

Every Engineer can be an Energy Superhero

Garrison: Climate, Buildings, and Behavior

John Silkey

May 23, 2012

Empowering engineers, saving energy and protecting your assets.

Which of these
hardly ever
happens?

The Life of an engineer

- Your front line defense against waste
- Good ones are hard to come by
- Underutilized resource that often is stretched too thin

“my light bulb
burned out”

“my cubical is
too cold”

“what’s that
smell in the NE
corner?”

“hey, I’d like to
save energy but I
don’t know how”

“you have so much work coming in day to day and you don’t have a chance to get into the why of things happening”

BETTERBRICKS
Powerful Energy Ideas. Delivered by NEEA.

S E A T T L E
2030
DISTRICT

The logo for Seattle 2030 District features the word "SEATTLE" in a spaced-out, grey, sans-serif font at the top. Below it, the number "2030" is displayed in a large, bold font, with the "20" in black and the "30" in green. The zero in "30" is a solid green circle containing a black silhouette of the Seattle skyline, including the Space Needle. At the bottom, the word "DISTRICT" is written in a green, spaced-out, sans-serif font.

Theory, Curriculum and Materials

TRAINING APPROACH

What were
the best
practices?

Theory behind the design

- Establish leadership support and reinforcement
- Make it simple
- Create a sense of “we”
- Embed this into existing decision-making processes
- Holistic approach
- On the job training – not a classroom approach
- Problem-based learning
- Connect change to emotion and logic

“When you are off on your own you get isolated and feel like you aren’t growing for awhile and when you sit there by yourself you go crazy.”

Energy Superheroes: **The Design**

Scoping 101

Instructor Led Walk-through

Scoping 201

Team Led Walkthrough

Group Discussion

Follow Up

- Building energy use, measurement and evaluation tools
- Scoping process, what to look for

- Divide participants into teams
- Follow instructor conducting walk-through

- Review scoping and potential findings
- Team creates an action plan

- Two teams lead their own walk-through in different buildings with instructor trailing and guiding

- As one group again, discuss new findings, lessons learned and create action plan

- Six to eight months later, instructor follows up with teams to review and discuss other findings since training

BUILDING OPERATIONS MANUAL

[Building Name]

[Author Name]

[Date Created]

This Building Operations Manual is intended to serve as the key reference manual for all building operators/engineers and preventative maintenance staff to understand the building use characteristics, systems installed and other data pertinent to the maintenance and high performance of the building. The manual should be updated after major remodels and system upgrades and as contact information changes.

Symptom-Diagnosis Tool

Introduction

You may notice possible symptoms of poor energy performance in your building. For example, a chilled-water pump might operate significantly more hours than the chiller. You then face the task of finding and resolving the underlying cause of the symptom. The cause of the symptom may in fact be a problem (for example, incorrect control settings) or it may be a condition that is not a problem or cannot be avoided (for example, setpoints that are based on the needs of a process load and not on occupant comfort).

Finding the cause of a symptom of poor energy performance will involve inspecting your building and collecting and analyzing trend logs from your Direct Digital Control (DDC) system. For general guidance in getting ready for these two activities, see:

- ▶ Getting Ready to Find Problems by Inspection (PDF)
- ▶ Getting Ready to Find and Confirm Problems by Trend-Logging (PDF)

Identifying Problems

Now you are ready to tackle specific symptoms and find the underlying cause. This Symptom-Diagnosis Tool helps you identify and better understand what causes a large number of important symptoms.

To use the Symptom-Diagnosis Tool:

- 1 Select the appropriate equipment type below to display a list of possible symptoms.
- 2 Select a candidate symptom from that list.
- 3 Read specific advice on what might be causing that symptom in that equipment.

To begin, select the appropriate equipment type:

- Air Distribution
- Boilers
- Chillers
- Cooling Towers
- Digital HVAC Controls
- Motors
- Sensors
- Steam Distribution
- Terminal Units
- Water Distribution

Commitment, Capacity, Connectivity, Savings and Persistence

SUCCESS

WRIGHT
RUNSTAD
& COMPANY

Profile

- Privately held commercial office development and property management firm
- 6,000,000 ft² office space

Energy Superheroes: Success Stories

Building A

Building B

Building C

Training Teams

15%
Savings

Trained 30 engineers (nearly 100%)

Cross-building teams established of 12 engineers

Every building has been scoped

WRIGHT
RUNSTAD
& COMPANY

“biggest value has been getting together with a bunch of other engineers and talking over things and going through buildings”

COMMITMENT

Profile

- Public university ~30,000 students
- 236 buildings = >14,800,000ft²
- Annual consumption =
220,963,070 kWh (\$15,661,570)
- Maintenance budget cut in half & operations
budget cut \$30M

Energy Superheroes: Success Stories

Building A

Shops

Managers/
Foreman

Training Teams

20%
Savings

Trained 100+ engineers (nearly 100%)

Cross-building teams established of six operations/maintenance staff

10 buildings scoped and savings being realized – roadmap being implemented

THE UNIVERSITY of
TENNESSEE **UT**
KNOXVILLE

CAPACITY

“It’s ok to let our guard down a little bit and accept some advice from other engineers...”

Empowered and Inquisitive

- Is a score of 12 good?
- We have steam traps? What’s a steam trap?
- **Does this need to be running?**
- Should the sensor be on the South side?
- What happens when steam consumption goes down?

“...knowing how important your sequence of operations is – understanding it and that you **don't have things fighting each other...**”

Holistic View

- What happens at night?
- **How do dirty filters impact building performance?**
- When a tenant complains about smells what does that really mean?
- Is it okay that the equipment isn't tied to the building automation system?

Learning and Evolving

OPPORTUNITIES

“I love the power of the follow up! – to have Jim come back and ask me ‘what are you doing?’”

Lessons & Opportunities

- Tons of savings to be gained with little out of pocket expense
- Coaching matters
- Cross-building training yields new perspectives and opportunities
- Tools (aka “homework”) have to be simple
- Without a goal, it’s just motion without progress

The Evolution

CREATING COMMUNITY

Profile

- 50% reduction by 2030
- Better Buildings Challenge Community Partner
- Private sector collaboration ~28M ft²
- Average Energy Star Score = 78

Energy Superheroes: **The Evolution**

10-15 Buildings <100,000 ft²

Training Teams

Cross-company team established

1:1 training

Group coaching on “mentor” building

Establish a goal with management

CONNECTIVITY
CONNECTIVELY

Thoughts, Questions, Suggestions

WRAP-UP

Your perspective

- How can we build this sense of commitment, capacity and connectivity into other work we do in buildings?
- How might property and asset managers also benefit from this approach?
- How can our learning best be shared with this group?
